Question text

A strobogrammatic number is a number that looks the same when rotated 180 degrees (looked at upside down).

Write a program to determine if a number is strobogrammatic. The number is represented as a string.

Example 1:

Input:

69

Output:

true

Example 2:

Input:

88

Output:

true

Example 3:

Input:

962

Output:

false

Example 4:

Input:

1

Output:

true

For example:

Test	Result
<code>print(Strobogrammatic(69))</code>	true
<code>print(Strobogrammatic(962))</code>	false

Answer:(penalty regime: 0 %)

def Strobogrammatic(n):
    n=str(n)
    r={'0':'0','1':'1','6':'9','8':'8','9':'6'}
    for i in range(len(n)//2+1):
        if n[i] not in r or r[n[i]]!=n[-i-1]:
            return "false"
    return "true"
```

Feedback

	Test	Expected	Got	
	print(Strobogrammatic(69))	true	true	
	print(Strobogrammatic(88))	true	true	
	print(Strobogrammatic(962))	false	false

Question text

complete function to implement coin change making problem i.e. finding the minimum

number of coins of certain denominations that add up to given amount of money.

The only available coins are of values 1, 2, 3, 4

Input Format:

Integer input from stdin.

Output Format:

return the minimum number of coins required to meet the given target.

Example Input:

16

Output:

4

Explanation:

We need only 4 coins of value 4 each

Example Input:

25

Output:

7

Explanation:

We need 6 coins of 4 value, and 1 coin of 1 value

Question text

A number is considered to be ugly if its only prime factors are 2, 3 or 5.

[1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, ...] is the sequence of ugly numbers.

Task:

complete the function which takes a number n as input and checks if it's an ugly number.

return ugly if it is ugly, else return not ugly

Hint:

An ugly number U can be expressed as: $U = 2^a * 3^b * 5^c$, where a , b and c are nonnegative integers.

For example:

Test	Result
<code>print(checkUgly(6))</code>	ugly
<code>print(checkUgly(21))</code>	not ugly

Question text

An e-commerce company plans to give their customers a special discount for Christmas.

They are planning to offer a flat discount. The discount value is calculated as the sum of all

the prime digits in the total bill amount.

Write an algorithm to find the discount value for the given total bill amount.

Constraints

$1 \leq \text{orderValue} < 10^{100000}$

Input

The input consists of an integer `orderValue`, representing the total bill amount.

Output

Print an integer representing the discount value for the given total bill amount.

Example Input

578

Output

12

For example:

Test	Result
<code>print(christmasDiscount(578))</code>	12
